

MUTASPACE CYBER LEARNING

Lab Evidence Checklist

Collect useful proof, preserve context, and publish only sanitized documentation.

Hands-on assignment companion

**CANVAS IS THE
COURSE RECORD**

Use Canvas for section announcements, schedules, grades, instructions, feedback, and official assignment submissions.

BEFORE THE OPERATION

Prepare the scope, environment, and evidence plan.

CHECK	ITEM	NOTES
☐	Read the full scenario and identify the authorized scope.	List systems, files, accounts, and techniques that are allowed.
☐	Review the success criteria and required deliverables.	Check Canvas for section-specific instructions.
☐	Create a working folder with clear file names.	Keep original evidence separate from edited copies.
☐	Record the starting state or create an approved snapshot.	Use a baseline screenshot, configuration export, or hash when appropriate.
☐	Identify the evidence needed to prove completion.	Plan screenshots, command output, logs, diagrams, tables, and validation results.

DURING THE OPERATION

Capture evidence that another analyst can understand.

CHECK	ITEM	NOTES
☐	Record the command, tool, setting, or action used.	Do not rely on a screenshot without explaining the action.
☐	Capture the relevant result, not the entire screen by default.	Keep enough context to identify the system and purpose.
☐	Add a short caption to every important image.	Explain what the evidence proves.
☐	Record errors, unexpected results, and troubleshooting steps.	A failed attempt can still demonstrate reasoning.
☐	Preserve timestamps or sequence information when timing matters.	Build a timeline for investigations and incident response.
☐	Separate facts, assumptions, and conclusions.	Use evidence to support each conclusion.
☐	Record configuration before and after a change.	Show that the intended control changed.
☐	Validate that legitimate functions still work.	Security changes should not break approved requirements.

BEFORE SUBMITTING IN CANVAS

Turn evidence into a complete technical record.

CHECK	ITEM	NOTES
☐	Use a descriptive title and identify the mission or operation.	
☐	State the scenario, objective, and authorized scope.	
☐	Describe the environment, tools, and evidence sources.	
☐	Explain the process in a logical sequence.	
☐	Label screenshots, diagrams, tables, and command output.	
☐	State the findings and connect each one to evidence.	
☐	Explain the control, remediation, or response recommendation.	
☐	Include validation results and any remaining limitations.	
☐	Complete the reflection and Security+ objective connection.	
☐	Open every submitted file and verify that it is readable.	

BEFORE PUBLISHING ON GITHUB PAGES

Sanitize the project and write for a public audience.

CHECK	ITEM	NOTES
☐	Remove passwords, tokens, keys, cookies, hidden flags, and other secrets.	
☐	Remove grades, Canvas screenshots, messages, real names, and personal information.	
☐	Remove restricted files, answer keys, confidential diagrams, and real organization data.	
☐	Replace sensitive details with fictional labels or written summaries.	
☐	Explain the project in your own words instead of uploading the full assignment instructions.	
☐	Include only the evidence needed to demonstrate the skill.	
☐	Add captions, alternative text, meaningful headings, and descriptive links.	
☐	Test the published page on desktop and mobile layouts.	
☐	Open the public URL in a private browser window and perform a final privacy review.	

QUALITY TEST

A reader should be able to answer: What was the problem? What did the student do? What evidence matters? What was the result? What did the student learn?

EVIDENCE INVENTORY

Use this space to plan the final package.
